

Solar chimney power generation

Can solar chimney technologies be used for building ventilation & power generation?

In this review article, the potential of solar chimney technologies for building ventilation, power generation and potable water generation in sole, hybrid and poly-generation modes has been reviewed extensively by highlighting their optimal configuration, pros, cons and economics.

What is solar chimney power plant?

The present paper presents an overview of the main characteristics of a novel kind of solar thermal application called solar chimney power plant. It is a technology of electric power generation using solar energy by employing basic physics that when air is heated it rises.

Are solar chimney power plants a reliable source of renewable electricity?

Department of Mechanical and Industrial Engineering, Ryerson University, Toronto, ON M5B 2K3, Canada

Author to whom correspondence should be addressed. This research presents a comprehensive review of solar chimney power plants (SCPP) as a reliable source of renewable electricity generation.

How efficient is solar chimney power plant?

Sole solar chimney power plant occupies huge land area and has efficiency of only 1.0%. However, under hybrid and poly-generation operation modes its efficiency has improved to 55%. Solar PV modules seem to be a suitable partner for solar chimney technologies and it enhances utilization factor by providing extra electric power output.

How a solar chimney power plant works?

There is a turbine in the chimney at a certain height from the ground. The kinetic energy of the system's air hitting the turbine blades is converted into electrical energy, and power output is obtained from the system. The simplified mechanism of the system is given in Figure 1. Figure 1. Solar chimney power plant scheme. 3.

Why should you choose a solar chimney power plant?

The ground beneath the transparent collector acts as a natural means of storing radiant energy. Simple technology: The maintenance and repair costs are low due to its simple structure. Solar chimney power plants have a simple design with only three essential components: a collector, a turbine, and a chimney.

In its simplest form, the solar chimney consists of a black-painted chimney. During the day solar energy heats the chimney and the air within it, creating an updraft of air in the chimney. The suction created at the chimney's base can be used to ventilate and cool the building below. In most parts of the world it is easier to harness wind power for such ventilation as with a windcatcher, but on hot windless days a solar chimney can provide ventilation where otherwise there would be none.

A new concept using solar chimney system to drive both power generation and seawater desalination systems was proposed by Wang et al. [15]. In this system, seawater ...

The traditional solar updraft tower has a power conversion rate considerably lower than many other designs in the (high temperature) solar thermal group of collectors. The low conversion rate is balanced to some extent by the lower cost per square metre of solar collection. Model calculations estimate that a 100 MW plant would require a 1,000 m tower and a greenhouse of 20 square kilometres (7.7 sq mi). A 200 MW tower of the same height would req...
